

# Silicon Detectors and Readout Electronics

Peter Fischer, ziti, Universität Heidelberg

# Content of the Lecture (sorted by subject)

- **Introduction:**
  - Applications of silicon detectors
  - Requirements, measured quantities
  - Interaction of particles & photons in silicon
- **Detectors**
  - pn diode and more general structures
  - Signal induction and spatial resolution
  - Detector Types (strips, pixels, CCDs, MAPS, APDs, SiPMs,...)
  - Manufacturing technology
  - Radiation damage
- **Readout Electronics**
  - Principle (charge amplifier, shapers)
  - Amplifiers (transistor level), Noise
  - Readout architectures, Trigger,...
- **Sample Applications & Projects**

# Literature

- **Semiconductor Devices**
  - S. M. Sze, Wiley, ISBN 0471874248
  
- **Semiconductor Radiation Detectors**
  - G. Lutz, Springer, ISBN 3540648593
  
- **Semiconductor Detector Systems**
  - H. Spieler, Oxford Science Publications, ISBN 9780198527848
  
- **Pixel Detectors**
  - Rossi/Fischer/Rohe/Wermes, Springer, ISBN 3540283323
  
- **Einführung in die Halbleiter Schaltungstechnik**
  - H. Göbel, Springer, ISBN 3540234454  
(With a CD with many nice Applets)

# Organization

- **Lecture:**
  - Wednesday, 11:15, here
  - Slides will be on SuS web site
    - <http://sus.ziti.uni-heidelberg.de/Lehre/Detectors1920>
  - Slides from 18/19 are available – they are very similar
  
- **Exercises:**
  - Tuesday, starting 5.11
  - Held by me and maybe partially a student
  
- **CP:**
  - 6, (accepted for MSc Physics and MSc Computer Engineering)
  
- **Examination:**
  - Oral examination, date can be agreed

# Introduction / Motivation

## Cameras for the Invisible

# Content

- The ‚normal‘ digital camera
- Basics:
  - Photons & other Particles
  - What do they do in silicon?
  - How does a silicon detector look like?
- Some types:
  - Pixel
  - CCDs
  - DEPFET
  - others...
- Applications:
  - Astronomy, Medicine, Material Science, Biology, Physics,...

# What's in a normal camera?

# The ,CMOS' Photo Sensor

<http://micro.magnet.fsu.edu/primer/digitalimaging/cmosimagesensors.html>

# Types of Radiation

- Photons (electromagnetic radiation)

- Electrons (radioactive decays, electron microscope)

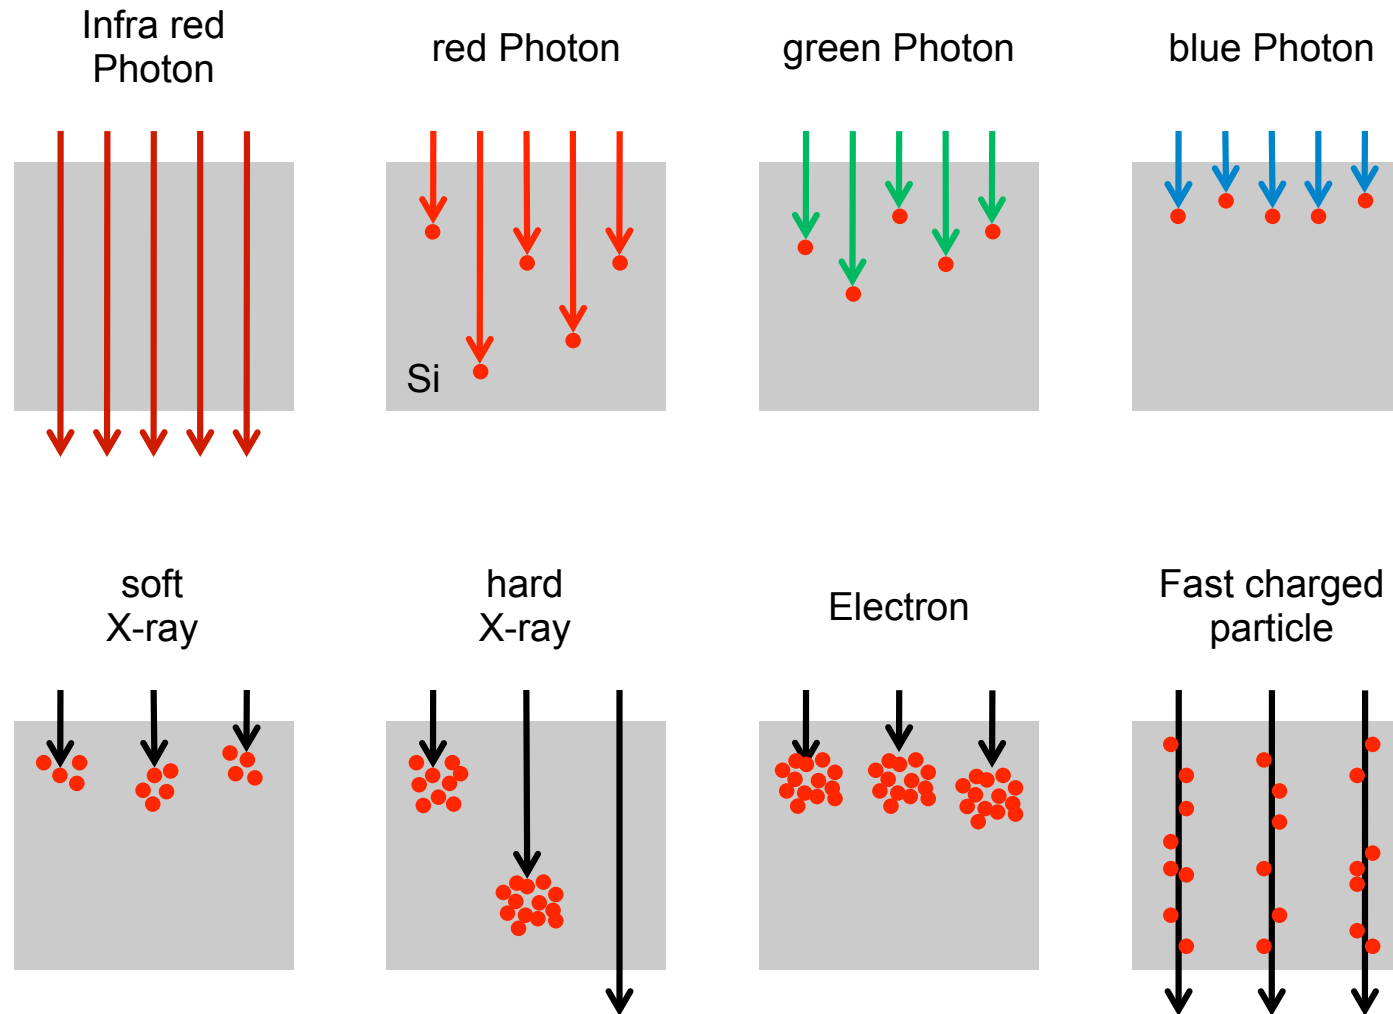

- Fast charged particles (physics, cosmic rays)

- Ions, neutrons, neutrinos,...

# Radiation in Silicon

- Atoms are ionized (electrons • are knocked off the shell)

# Silicon

# Silicon Crystal

Face centered  
Cubic lattice

# Silicon: Crystal & Doping

doping with  
5-valued atoms:  
- **N-conductor**  
- Donators **positive**

doping with  
3-valued atoms:  
- **P-conductor**  
- Acceptors **negative**

# The pn-junction (diode)

- A **depletion zone** with no charge carriers is created
- There is an **electric field**

# Signals in a pn-diode

## Summary pn-diode

- By clever doping, a **depletion zone** is created  
With high external voltage (100V), it can be 'thick' (0.3 mm)
- There is a strong **E-Field** in the depletion zone
- Electrons (and holes), created by particles / light are separated and pulled to the electrodes
- They are detected with an **amplifier**
- Example: In 300 $\mu$ m silicon, we get for
  - Photon 1 electron
  - 10keV X-ray 2.800 electrons
  - Fast particle 18.000 electrons
- The electronic **noise** must be below this
- NB: electron deficiencies (holes) were omitted here  
We need them to 'see' the full signal!

# DETECTOR TYPES

# Pixel and Strips

- The surface can be segmented to provide spatial information:

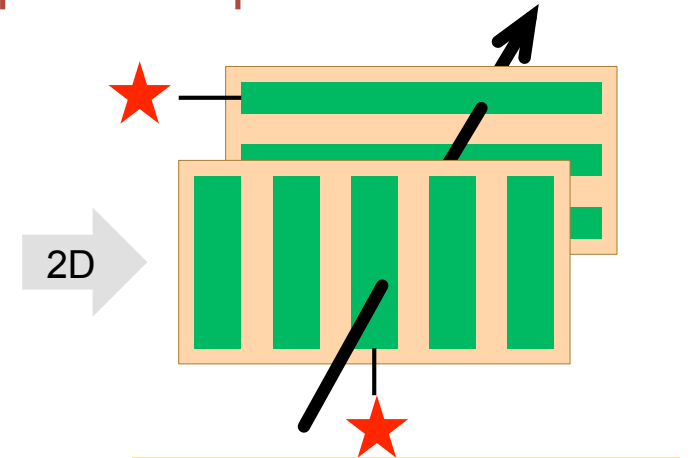

## PIXELS

- + 2D information
- + complex images possible
- + small capacitances, → low noise
- + single sided device
- many amplifiers
- small areas (chip size is limited)

## STRIPS

- Only 1D
- + large areas
- + few amplifier
- large capacitances, → high noise

## two layers

- only for penetrating particles
- more material (scattering)

## double sided

- + for absorbing particles!
- isolation of strips, potential difference front/back, cost

# Animation of Normal Depletion

# Hybrid Pixel: Chips + Detector (Flip Chip)

- Sensor: pn-diode with segmented electrode, also other materials, also gas
- Chip: Amplification & readout
- Interconnect: many 'bump' spheres
- Advantage: flexible readout, fast

# Strip Detectors

- One (or both) sides are segmented into strips ( $\sim 50\mu\text{m}$ )
- Readout with chips at the side
- Advantage: Few channels for high spatial resolution, fast

strip

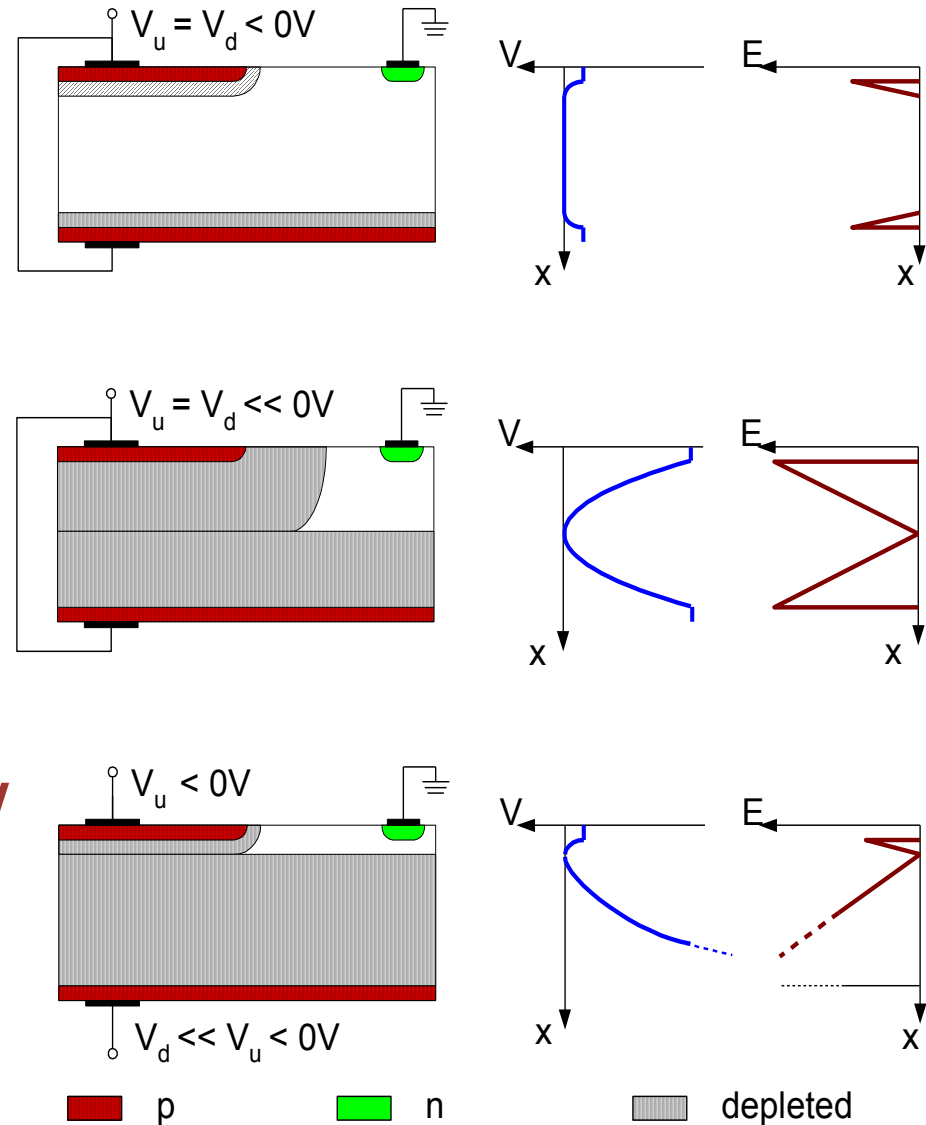

Chips

Strips

# Fully depleted CCDs: Sideward Depletion

- Depletion from **both sides**
- This gives a **potential minimum in the volume** (for electrons)
- With asymmetric voltages, the minimum can be moved just **below the surface**

# Animation of Symmetric/Assym. Sideward Depletion

# Silicon Drift Detector

- Both sides are segmented
- Increasing potentials create a *lateral* field

- Advantages: few readout electrodes, no extra material in active area, very low noise (few  $e^-$ )

# Animation Silicon Drift Detector: Synchronous Case

- Position is encoded in arrival time difference
- This requires charges to start *at the same time!*

# Animation Silicon Drift Detector: Problem

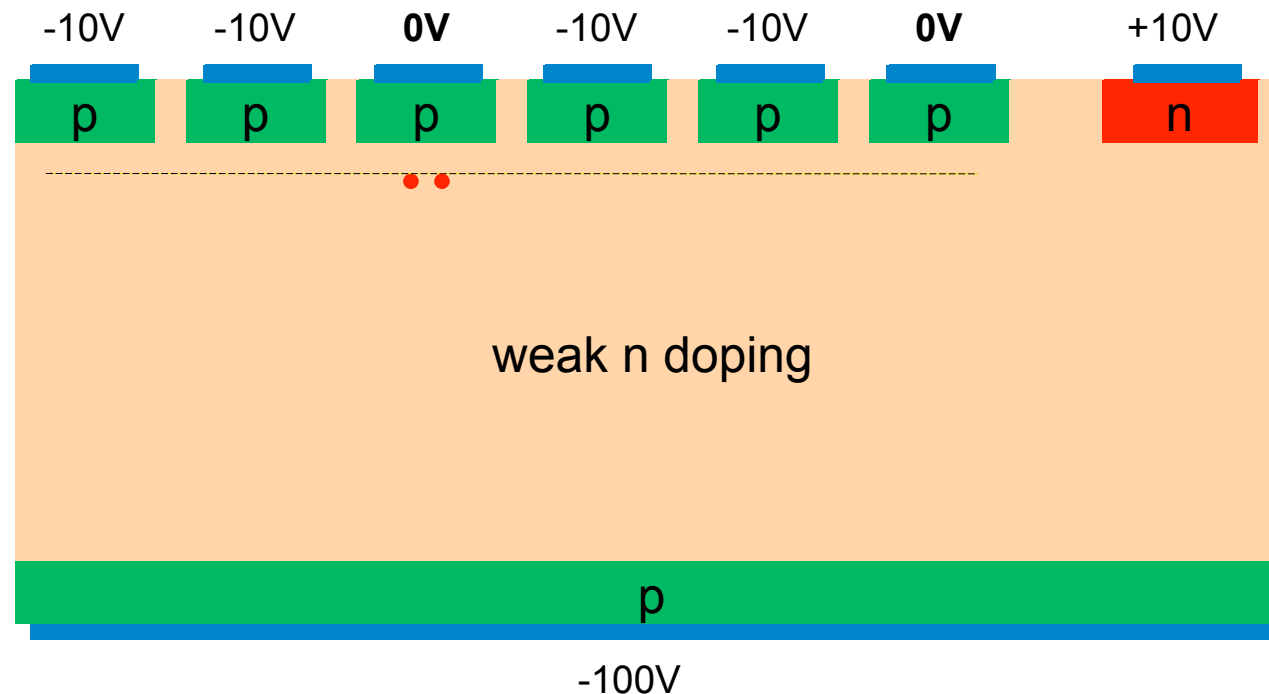

- Position *cannot be reconstructed* if the drift start unknown!
- e.g.: radioactive decays

# Fully depleted CCD

- Upper side is divided into strips
- Electrons accumulate under the positive strips
- They are 'shifted' with positive voltages to the edge

- Advantages: few readout electrodes, no extra material in active area, very low noise (few  $e^-$ )

# Animation: Fully Depleted CCD

# Controlled Drift Detector

- First Collect Charges in potential pockets
- Then drift by *switching off* the potential wells

# Internal Amplification: DEPFETs

- Charge collection like in CCD
- p-channel Transistor **inside the detector** amplifies signal

- Very low noise, fast

## Further types

- DSSD Double Sided Strip Detector:  
n- and p- side are patterned (orth. / oblique)
- MAPS Monolithic Active Pixel Sensor:  
Integration of Sensor and readout into CMOS
- APDs Avalanche Photo Diodes:  
Internal Amplification with very high E-fields
- SiPMs Silicon Photo Multiplier:  
Decoupled arrays of small APDs for high rate
- PingPong Multiple readout of same charge  $\rightarrow$  noise  $< 1 e$
- ....

# System Design

- A full Detector System consists of many components
  - Sensors
  - Front End Chips
  - Front End 'Hybrids'
  - Support Mechanics
  - Cooling
  - Power Supplies, HV
  - Detector Slow control (temp. Mon, moisture, HV,..)
  - Backend Electronics (data transport & sorting, Trigger)
  - Data Acquisition Software
  - (Online) Monitoring Software
  - Analysis Software
